The Dreadful Technical Discovery

Not for the faint of heart

Agenda

[redacted]

1 What is “technical discovery”

2 Why “technical discovery”

3 When “technical discovery”

4 How “Technical

discovery”5Technical

evaluation

6Workshop - Let’s give it a try

What is it?

Technical discovery is a critical phase in the project lifecycle where we:

Do our best to understand what the hell the customer needs, not what he wants

Why do it?

[redacted]

- **Client:** *"Hi, I want to build an automatic product description generator"* -

You: *"Sure, that's a doable use case"*

- **Client:** *"I've already played around with ChatGPT and it looked pretty simple and*

worked most of the times"

- **You:**

[redacted]

- People are forgiving towards chat playgrounds (why not? It's cool)
- Gemini/ChatGPT/Cluade is a product not a model (give it a try - same prompt API vs. Chat)
- Pretty good is not enough.
- A good prompt only takes you so far (won't solve everything, yet...)

[redacted]

- **Client:** *"Hi, I want to build an automatic product description generator"* -

You: *"Sure, that's a doable use case"*

- **Client:** *"I've already played around with ChatGPT and it looked pretty simple and worked [redacted]"*

- **You:**

So what does the client really needs? any guesses?

[redacted]

- An online retail 3rd party marketplace.
- many languages.
- Had two issues:
  - marketplace is full with bad descriptions
  - new products are uploaded every day that may contain bad descriptions

So what does the client really needs? any guesses?

[redacted]

- define parameters for what is a bad description (not trivial)
- Create a product description classification system
- Create product description generation system
- Build a unified system out of the above

QUESTIONS?
?
...

When to use it?

[redacted]

Value

Opportunity is big enough to justify moving forward

Buy in

Client has the resources (technical and financial) to support the use case

Feasibility

Use case is valid and technically feasible

How to?

[redacted]

Today

How is it working today? down to the smallest detail...

Problem

what's wrong with it? why is it painful? did you try to fix it?

Tomorrow

How and why do you want to solve it with GenAI?

Technical Evaluation

Technical evaluation is a critical phase in the project lifecycle where we:

Collect everything we need to know before moving forward into designing a GenAI based system

[redacted]

The final product? its Purpose?
How will it be used? How LLM fits in?

Product

Source?
Structure? Availability?

Data

Expected output? NO-GOs?
Must vs. Nice to have?

Result

Resources
Knowledge
Infrastructure

Constraints

[redacted]

Is it technically feasible?

Feasibility

Is it worth our time?
do we really need to use GenAI here?

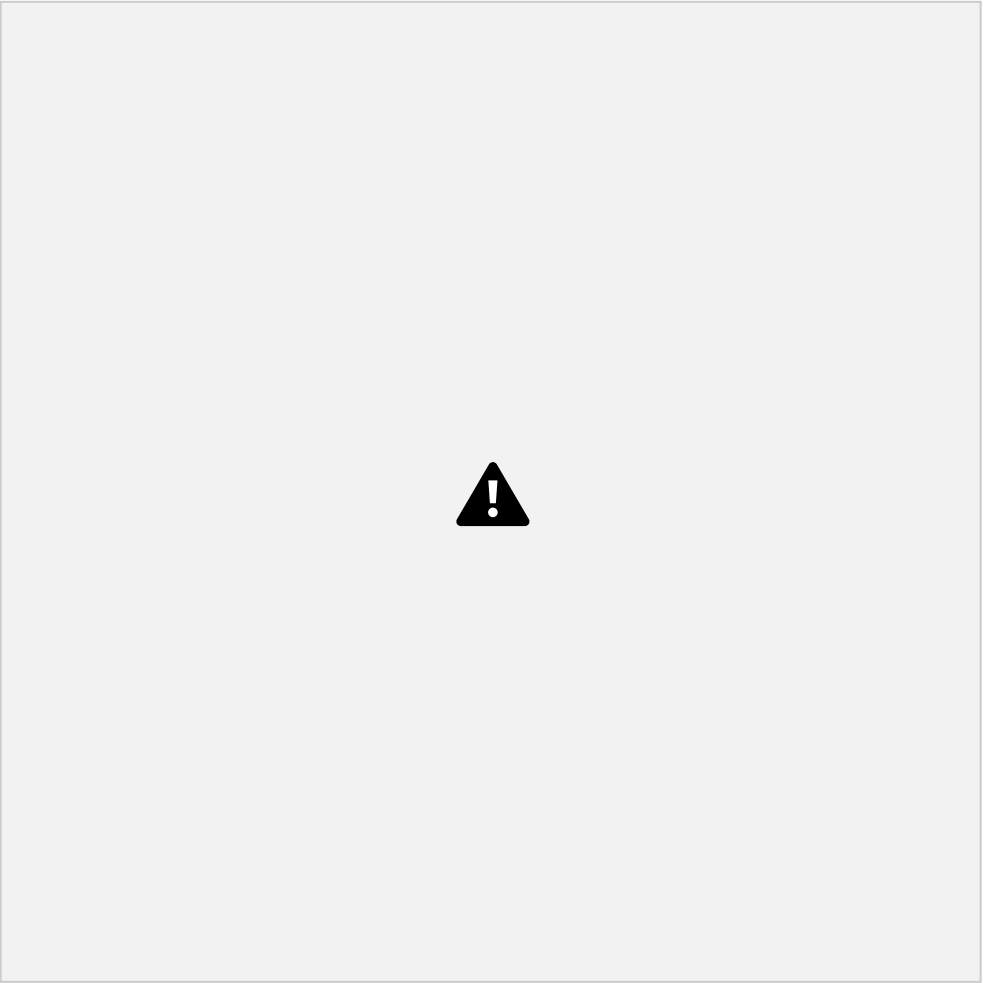
Profitability

do all resources exist? (Manpower, data, budget, compute, time, knowledge etc.)

Capability

Are the necessary resources available? Is there willingness to invest them?

Readiness



Let’s practice

- divide into 5 Teams of 5 (+1)
- every team will be divided into 2 groups (client, GenAI company/department)
- Task:
  - Client group - should come up with a business problem they have and want to solve with GenAI
  - GenAI group - research the client and prepare for a meeting
  - Each team will have 10 min to play the meeting

Take 1, Action! ⚠

[redacted]

Technical discovery and evaluation are critical in the world of business!!!

GenAI is cool but that’s not enough to make companies use it…

if you want adoption you need to solve a real business pain.

How?

Understand the problem and the client needs, evaluate the technical and business landscape of the project and make a decision.
